

Character Pad — Play Store Review Analysis

Twelve UX findings from 1-4★ reviews · com.husseinefky.characterpad

4 June 2026

Method

Every 1-4★ review carrying text was read and grouped by the problem it reports. The clusters that held up were weighted by reach and ranked. **Twelve UX findings emerged**, set out below in priority order with the evidence behind each. A closing section records the defects that fall outside them.

Play Store's review endpoint filters by the `hl` locale — an `hl=en` scrape returns 724 reviews and hides almost every non-English one, including several of the highest-voted complaints below. The corpus comes from a sweep of ~85 locale/country pairs against the `batchexecute` endpoint, run until saturation.

Measure	Value
Reviews with text in corpus	2,299
1-4★ with text (actionable pool)	634
Weighted voices in that pool	2,040
Carried by the twelve findings	232 reviews / 1,219 voices (60% of the pool)
App state	v1.2.1, last updated 1 March 2019

Scoring. *Voices* = $\Sigma(\text{upvotes} + 1)$, counting the reviewer alongside everyone who upvoted them. Ranking on voices rather than review count is what surfaces findings 6 and 7, each of which rests on two or three reviews that hundreds of users endorsed.

Caveats. Every one of the 634 was read individually. The 360 that no finding claims are overwhelmingly content-free — 278 of them are under 25 characters (“Good”, “Nice”, profanity), carrying a star rating but no usable signal. A review raising more than one finding is counted in each; 19 do, and the largest overlaps are noted in place.

Findings ranked by weight

#	Finding	Voices	Revs	Avg★	Span
1	Hard to Find Specific Characters / Symbols	367	87	3.0	2016-2024
2	Characters Not Displayed / Blank Boxes / Unsupported	244	47	2.3	2016-2024
3	Language Barrier (English Only)	240	26	2.4	2018-2022
4	Difficult to Use / Not Intuitive / Confusing UX	135	46	2.1	2016-2023
5	Not a Keyboard / Expected Keyboard Integration	120	26	2.3	2016-2023
6	Accidental Text Deletion (Clear Button Placement)	94	2	3.0	2020
7	Accidental Scrolling	85	3	3.7	2018-2022
8	Text Composer Placement Causes Search Bar Confusion	74	3	4.0	2017-2021
9	Floating Clipboard Quick Access	37	5	3.8	2019-2023
10	Characters Too Small / No Zoom	31	4	2.8	2017-2020
11	Cannot Create Custom Characters	27	6	3.7	2017-2024
12	Floating Clipboard Sizing Configuration	24	4	3.8	2017-2022

Findings are numbered in descending order of weight, so the number is itself the priority rank. Findings 1-3 carry 851 of the 1,219 mapped voices — **70%**. Everything below finding 8 is a long tail in the thirties and twenties.

1. Hard to Find Specific Characters / Symbols

367 voices • 87 reviews • avg 3.0★ • 2016-2024 — the largest finding, and the only one above 300. It splits into three sub-clusters that need different fixes:

Sub-cluster	Voices	Revs
a) Present in the app, but users can't find it — search & IA failure	119	30
b) Superscript / subscript coverage gaps	141	15
c) Characters genuinely absent, or additions requested	107	42

The split matters: most symbols named as “missing” across the corpus — π , α , $\neq$, $\sqrt{\quad}$, $\therefore$, $^{\circ}$, $^{\circ}$, NZRC — **do** exist in Unicode and almost certainly in the app. Sub-cluster (c) is therefore smaller than it looks, and a good share of it is really (a) wearing a content-gap costume.

a) Present but unfindable — 119 voices

2★ • 25 upvotes — “All I wanted was a simple check mark or similar type symbol to paste into a shipping list on my notepad. Ridiculous, out of all these, literally thousand or so symbols I couldn't find what I needed and the list is in microscopic view doesn't help matters.”

3★ • 1 upvote • German — Ich suche schon den ganzen Tag ein Farvahar Symbol. Ich könnte mir vorstellen, dass es dieses sogar hier gibt, aber alles ist zu unübersichtlich als dass ichs finden kann.

“I've been looking for a Faravahar symbol all day. I could imagine it's even in here, but everything is too cluttered for me to find it.”

That review is the cleanest statement of the problem: the user assumes the symbol is present and still gives up.

4★ • 3 upvotes • Russian — слишком много повторяющихся символов на корейском японском и особенно на китайском, приходится три часа сидеть листать искаая нужные символы :(

“Way too many repeated characters in Korean, Japanese and especially Chinese — you have to sit scrolling for three hours looking for the symbols you need :(”

4★ • 2 upvotes • Chinese (Traditional) —

喜歡吧，幾乎所有的EMOJI及SYMBOLS應有盡有，但就是因為符號實在太多了，要找到所要的符號就得要花很多時間才能找到。

“I like it — almost every emoji and symbol you could want is there. But precisely because there are so many symbols, it takes a long time to find the one you want.”

1★ • 1 upvote • German — Eigentlich mega gut nur VIEL zu viel und mit VIEL meine ich sehr sehr viel zu viel man findet GARNICHTS

“Actually really great, just WAY too much — and by too much I mean far, far too much. You can't find ANYTHING.”

Requested remedies from within this sub-cluster: search by codepoint (**3★ • 1 • Chinese (Traditional)** 希望可以直以代碼查詢，例如搜尋2026會直接出現「...」 — “I hope you can search directly by code — e.g. searching 2026 would bring up ‘...’”); search by description (**4★ • 0** — “adding search function via looking for specific description”); tabs rather than one list (**4★ • 6 • French**); and an option to sort by ascending codepoint (**4★ • 0**).

b) Superscript / subscript coverage gaps — 141 voices

A genuine Unicode limitation — no complete sub/superscript alphabet exists — but the app never says so, so users read it as a defect. The highest-voted item in the whole finding is a **1★** triggered by one missing

glyph.

1★ • 48 upvotes • Indonesian — huruf y untuk di atas nama kok gak ada??

"Why isn't there a superscript 'y' (to put above a name)?"

3★ • 19 upvotes — "Not all characters are there in subscript and superscript section. Also there is no option to add new letters... so either you add it or give option to add the missing letters as user needs."

2★ • 14 upvotes — "the subscripts provided are not of all the alphabets or letter be it greek symbols or any other letter."

4★ • 12 upvotes • French — dans "superscripts and subscripts", il n'y a que quelques lettres mais j'aurais avoir l'alphabet complet s'il vous plaît.

"In 'superscripts and subscripts' there are only a few letters — I'd like the complete alphabet please."

A one-line explainer in that section would likely convert most of these.

c) Genuinely absent or requested — 107 voices

4★ • 14 upvotes • Spanish — Es una muy buena opción, pero no tiene el tipo de letra que estaba buscando en específico... si alguien sabe, como se instala el wingdings?

"It's a very good option, but it doesn't have the specific typeface I was looking for... if anyone knows, how do you install Wingdings?"

4★ • 2 upvotes • French — il manque les ensembles de nombres genre $\mathbb{N}$, $\mathbb{Z}$, $\mathbb{R}$ et $\mathbb{C}$ et ya des flèches d'implication vers la droite, gauche, le haut, le bas mais il manque celle d'équivalence. Il manque également l'exposant -1 qui est bien utile. A côté de ça vous avez des étoiles filantes et des paires de ciseaux.

"The number sets like $\mathbb{N}$, $\mathbb{Z}$, $\mathbb{R}$ and $\mathbb{C}$ are missing, and there are implication arrows pointing right, left, up, down but the equivalence one is missing. The -1 exponent, which is very useful, is also missing. Meanwhile you have shooting stars and pairs of scissors."

2★ • 0 upvotes — "The one symbol I want, is MIA. Looking for pi and cannot find it. Also seem to be missing standard deviation and x bar for average as well."

π is in the app. This review sits in (c) by the reviewer's framing but belongs to (a) by cause — the pattern repeats across the sub-cluster.

2. Characters Not Displayed / Blank Boxes / Unsupported

244 voices • 47 reviews • avg 2.3★ • 2016-2024 — the most persistent finding by span. The app ships a "supported characters" filter, but users don't find it, it is gated to Android 6+, and by Android 14 it had stopped working.

1★ • 42 upvotes • Spanish — No aparecen todos los simbolos, solamente los primeros a pesar de que mi android es 7.1.1

"Not all the symbols show up, only the first ones, even though my Android is 7.1.1."

4★ • 45 upvotes • Indonesian — Ini aplikasi bagus, bagi yang mengeluh dengan kotak tersilang: untuk membuka karakter yang tidak tampil atau berupa kotak tersilang, ada di pengaturan. Tepatnya pada bagian tampilan karakter namun aplikasi menjadi sedikit lambat karena banyaknya (ribuan) karakter yang di tampilkan dalam satu halaman.

"This is a good app. For those complaining about the crossed-out box: to show characters that don't display or appear as a crossed box, it's in the settings — specifically under character display. But the app becomes a bit slow because of the many (thousands of) characters shown on one page."

A user doing the developer's onboarding, and naming the performance cost of the workaround in the same breath.

3★ · 0 upvotes · 2024 — “The app needs at least a maintenance update. In Android 14, the character [U+1D9F5] represents ‘not supported characters.’ Earlier Android versions used to have an X inside the box. However, [U+1D9F5] still appears when the option ‘Supported Characters’ is enabled. Basically, that option doesn’t work, and hope its fixable.”

(The glyph the reviewer pasted is U+1D9F5, substituted here by its codepoint — no font on the typesetting machine can render it either, which is rather the reviewer's point.)

3★ · 1 upvote · Spanish — únicamente para Android 6+ puedas filtrar los caracteres no reconocidos. Realmente no sé al respecto pero no creo que sea tan complicado crear un algoritmo capaz de filtrar los caracteres que se vean iguales al caracter de “desconocido” del sistema.

“Only on Android 6+ can you filter unrecognised characters. I don’t really know, but I don’t think it’d be that complicated to build an algorithm that filters out characters that look the same as the system’s ‘unknown’ character.”

Also: **4★ · 10 · Indonesian** masih banyak yang bersimbol untuk pengguna Android 6.00 (“There are still a lot showing as boxes for Android 6.00 users”); **3★ · 1 · Chinese** 很多出現空格與叉叉 (“Lots show up as blanks and crosses”); **1★ · 1 · Italian** la maggior parte dei simboli non si vedono (“Most of the symbols don’t display”); **4★ · 2 · Polish** niektóre symbole się nie wczytują (“some symbols don’t load”); **3★ · 0 · German** leider können trotzdem viele Zeichen auf dem Smartphone nicht angezeigt werden (“unfortunately many characters still can’t be displayed on the smartphone”); **1★ · 6 · Spanish** no se ve en Samsung Galaxy J4+ (“Doesn’t display on Samsung Galaxy J4+”).

3. Language Barrier (English Only)

240 voices · 26 reviews · avg 2.4★ · 2018-2022 — entirely invisible to an English-only scrape. Korean and Japanese reviewers dominate; several state plainly that they uninstalled because they could not read the UI.

3★ · 49 upvotes · Korean — 다양해서 좋네요 😊 다만 영어로 써 있어 무슨말인지 모르겠어요 😞 한국어 버전이 나오면 좋겠네요 😊

“Great that there’s so much variety 😊 But it’s written in English so I don’t understand what it says 😞 I hope a Korean version comes out 😊”

3★ · 29 upvotes · Korean — 특수문자가 여러종류가 있어 다양하게 쓸수 있었고 유용했습니다. 하지만 영어로 되어있어 영어를 모르는 사람들은 무슨 말인지 모르고 이해가 되지 않아 찾는게 좀 어렵습니다.

“There are many kinds of special characters, so I could use them in lots of ways — it was useful. But since it’s in English, people who don’t know English can’t tell what it says, so finding things is rather difficult.”

That review links findings 3 and 1 explicitly: the language barrier is itself a findability barrier.

1★ · 19 upvotes · Japanese — 使いたくてインストールしましたが、英語で全く読めない。使えませんでした...

“I installed it because I wanted to use it, but it’s in English and I can’t read it at all. I couldn’t use it...”

4★ · 10 upvotes · Spanish — Es buena aplicación ya que contiene gran cantidad de símbolos pero solo se encuentra en inglés por lo que para que otra gente que no sabe inglés es difícil entender

“It’s a good app since it has a large number of symbols, but it’s only in English, so it’s hard for people who don’t know English to understand.”

1★ · 8 upvotes · Turkish — Güzel bir uygulama değil tavsiye etmiyorum dili de türkçe kullanılmıyor

“Not a nice app, I don’t recommend it — and it isn’t available in Turkish either.”

Also: **4★ · 11 · Japanese** 使いたいけど文字が英語で日本語版とかは無いのですか? (*"I want to use it, but the text is in English — is there no Japanese version?"*); **3★ · 7 · Korean** 번역좀 부탁드립니다 (*"Please add a translation"*); **3★ · 5 · Italian** manca una lingua importante come l'Italiano (*"An important language like Italian is missing"*); **1★ · 1 · Chinese** 全英文介面, 很不方便 (*"An all-English interface — very inconvenient"*); **1★ · 1 · Spanish** No tiene para cambiar de idioma eso lo friega la app (*"There's no way to change the language — that ruins the app"*).

4. Difficult to Use / Not Intuitive / Confusing UX

135 voices · 46 reviews · avg 2.1★ · 2016-2023 — the lowest average rating of any finding, and the finding the full review pass grew most. Diffuse by nature: these reviewers report being lost without naming a specific control. It overlaps finding 3 heavily — users who cannot read the UI also cannot self-serve.

2★ · 17 upvotes · Korean — 어떻게 하는지 전혀 모르겠어요.

"I have absolutely no idea how to use this."

1★ · 8 upvotes · Arabic — الاستعمال كيف

"How do you use it?"

1★ · 6 upvotes · French — Ce que j'ai pas compris : déjà c'est en anglais donc c'est difficile, et je ne sais pas comment l'utiliser. Je suis désolé mais je n'aime pas cette application.

"What I didn't understand: first, it's in English so it's difficult, and I don't know how to use it. I'm sorry but I don't like this app."

1★ · 3 upvotes · Portuguese (profane) — muito difícil de usar. eu quase fiquei louca com esse aplicativo, os símbolos são ótimos, mas é muito difícil usar essa caralha

"Very hard to use. I nearly went crazy with this app — the symbols are great, but the damn thing is very hard to use."

1★ · 1 upvote — "I never saw the character matrix from which to make a selection. I don't get your app. It doesn't do what the Microsoft charmap.exe program does."

One review names the specific cause — the app is unusable until you configure it:

4★ · 1 upvote · German — Man muss zuerst im Menü die gewünschten Einstellungen vornehmen um das ganze übersichtlicher zu machen. Ohne die voreinstellungen geht man sehr schnell verloren und ist ermüdend.

"You first have to go into the menu and set up the options you want to make things clearer. Without those presets you get lost very quickly, and it's tiring."

5. Not a Keyboard / Expected Keyboard Integration

120 voices · 26 reviews · avg 2.3★ · 2016-2023 — the largest finding outside the top four. The consistent shape is an expectation mismatch: users install a "character" app expecting an input method, and find a copy-paste catalogue instead.

2★ · 26 upvotes · Korean — 영어로 되어 있어서 이해가 잘 안 가고 키보드에 적용이 안 돼요(제가 디자인 키보드를 써서 그런지 모르겠지만)

"It's in English so I don't really understand it, and it can't be applied to the keyboard (maybe because I use a custom keyboard, I'm not sure)."

1★ · 11 upvotes · Chinese (Traditional) —

什麼東東, 一點也不好, 太花俏了, 找出某一個符號得有很多美國時間才行!!! 常用的符號就那幾個, 何不設計出一個鍵盤式快捷列?

"What is this thing? Not usable at all, way too fancy. Finding one particular symbol takes forever! There are only a

handful of commonly-used symbols — why not design a keyboard-style quick-access bar?”

4★ • 9 upvotes • French — cette application est hyper cool mais c’est dommage qu’on doive copier coller ça serait mieux ajouter à notre clavier

“This app is super cool, but it’s a shame you have to copy-paste — it’d be better to add it to our keyboard.”

1★ • 8 upvotes • Thai — ทำไมเอาสัญลักษณ์ไปเขียนไม่ได้

“Why can’t I take the symbols and actually write with them?”

3★ • 9 upvotes • Portuguese — O ruim é que a gente tem que copiar os símbolos para montar um nick, esse aplicativo tá abandonado pelo jeito, não recebe atualização.

“The bad part is you have to copy symbols one by one to build a nickname. This app looks abandoned — it gets no updates.”

The Chinese review above also proposes the remedy raised independently in finding 9: a short quick-access bar for the handful of symbols actually used often, rather than the full catalogue.

6. Accidental Text Deletion (Clear Button Placement)

94 voices • 2 reviews • avg 3.0★ • 2020 — only two reviews, but they are the **second- and fourth-highest-voted in the entire actionable pool**. Both are Indonesian, both describe the identical failure, and both propose the same fix. The highest voices-per-review ratio of any finding, at 47.

4★ • 55 upvotes • Indonesian — suka banget sama ni aplikasi. ga ada bug atau semacamnya, dan super gampang banget buat digunakan jd bisa bikin nickname keren. tapi yang buat gasuka, pas udah ngedit susah” gasengaja mencent tanda X. aduh ngulang lagi, please deh ya X nya dipindah aja letaknya.

“I really like this app. No bugs or anything, and it’s super easy to use so I can make cool nicknames. But what I don’t like: after I’ve painstakingly finished editing, I accidentally hit the X. Ugh, start all over again. Please just move the X somewhere else.”

2★ • 37 upvotes • Indonesian — Sebenarnya app ini tuh bagus, tapi ak kesal saat sudah menulis dgn banyak kata... tiba tiba kepencet tombol silang disamping teks itu membuat teks hilang padahal dah susah susah ak bikinnya malah kehapus semua, tolong tombol silangnya jangan ditaruh disamping teks 🙏

“Honestly this app is good, but I get frustrated when I’ve typed a lot of text... suddenly I hit the X button next to the text and the text disappears. I worked hard on it and it all got deleted. Please don’t put the X button next to the text 🙏”

Note the first reviewer gave 4★ and opens with “no bugs or anything” — the damage here is destroyed work, not a perceived defect, which is why it reads as an unusually cheap high-value fix.

7. Accidental Scrolling

85 voices • 3 reviews • avg 3.7★ • 2018-2022 — few reviews, but anchored by the single highest-voted actionable review in the corpus. All three describe the viewport moving when the user did not ask it to.

4★ • 66 upvotes (*highest-voted actionable review overall*) — “Almost perfect. It does everything I need. My only complaints are that it’s very easy to accidentally trigger fast scrolling in the continuous view (a feature I’d like to disable as there’s an index that’s more useful), and I often mistake the text box at the top for a search box.”

3★ • 14 upvotes — “in advance view. The scroll down is buggy, it’ll either jump down or up as you try to advance either down or up. The second bug I found is with the go to codepoint. Sometimes it doesn’t come up.”

4★ • 2 upvotes — “please consider making a left hand mode or at the very least adding an option to make the cursor visible. I’m constantly tapping the right side of the screen by accident and jumping to some random

| character block.”

Two concrete asks recur: **an option to disable fast-scroll**, and **a visible scroll cursor** (or left-hand placement) so the touch target stops being hit by accident.

| The 66-upvote review raises findings 7 and 8 in one sentence, so its 67 voices are counted in both. Findings 7 and 8 should be read as overlapping, not additive.

8. Text Composer Placement Causes Search Bar Confusion

74 voices · 3 reviews · avg 4.0★ · 2017-2021 — weight here rests almost entirely on one review, and that should temper how the number is read. The direct evidence is a single sentence, but it comes from the most-upvoted actionable reviewer in the corpus, and two further reviews corroborate that search is the function users expect at the top of the screen.

Direct:

| **4★ · 66 upvotes** — “I often mistake the text box at the top for a search box (might be easier if the text box were at the bottom, away from typical search box placement?).”

The reviewer supplies the fix as well as the diagnosis: move the composer to the bottom, out of the position convention reserves for search.

Corroborating — users looking for search at the top and not finding it:

| **4★ · 5 upvotes** — “Outstanding developer responsiveness. The search feature is hidden; it ought to be default. Recommend.”

| **4★ · 0 upvotes** — “I do think you could improve it a lot by adding search function via looking for specific description. Good app anyway.”

Read together with finding 1a, the pattern is consistent: search is the primary need, the top of the screen is where users go looking for it, and the composer is occupying that slot.

9. Floating Clipboard Quick Access

37 voices · 5 reviews · avg 3.8★ · 2019-2023 — the theme is reaching the floating clipboard *quickly and from outside the app*. One reviewer says the floating window is the only reason they installed it, and cannot get it to work outside the app.

| **4★ · 13 upvotes · Portuguese** — Eu amei o aplicativo mas como funciona aquela janela flutuante? Como que deixa ela na tela? Ela só funciona dentro do aplicativo mas fora do aplicativo eu não consigo ativar ela... Eu praticamente só baixei o aplicativo só por conta da janela flutuante.

| *“I loved the app, but how does that floating window work? How do you keep it on screen? It only works inside the app — outside the app I can’t activate it... I basically only downloaded the app for the floating window.”*

| **4★ · 19 upvotes** — “AND AT LEAST WHY CAN’T I SWIPE TO THE SIDE TO SEE MY OTHER FAVORITES (in this floating window)???”

| **3★ · 0 upvotes · 2023** — “Please make an option for starting with the floating small pad first. **I’d love to pay for it.**”

| **4★ · 0 upvotes** — “Quite a good app. Should add a widget in order to activate the clipboard more easily”

| **4★ · 0 upvotes** — “Background running App button at the top of process bar. Whenever just touch to open this app. Maybe this become real, will be very cool!”

Four distinct entry points are requested across five reviews — launch straight into the floating pad, a home-screen widget, a notification-bar button, and swipe-through within the pad itself. One reviewer volunteers to pay for it.

10. Characters Too Small / No Zoom

31 voices · 4 reviews · avg 2.8★ · 2017-2020 — small but consistently framed as a barrier to the core task rather than a preference. In the top-voted case, legibility is named as an aggravating factor in a findability complaint (finding 1a), not as a standalone gripe.

2★ · 25 upvotes — “out of all these, literally thousand or so symbols I couldn’t find what I needed and **the list is in microscopic view doesn’t help matters.**”

1★ · 0 upvotes — “Keys are way too small. Can’t read or see the symbols”

4★ · 0 upvotes — “Just got it.. but so far so good. Edit: Can’t seem to zoom in though which isn’t cool..”

4★ · 2 upvotes — “Awesome app. A larger font would be nice, but overall pretty cool”

Two distinct remedies appear in the evidence: a **larger default glyph size**, and **pinch-to-zoom**, which one reviewer looked for and could not find.

11. Cannot Create Custom Characters

27 voices · 6 reviews · avg 3.7★ · 2017-2024 — low volume, but a steady drip across seven years and a high average rating: these are satisfied users naming one absent capability. Two of the six are among the most recent substantive reviews in the whole corpus.

3★ · 19 upvotes — “Not all characters are there in subscript and superscript section. Also there is no option to add new letters... so either you add it or give option to add the missing letters as user needs.”

This is the bridge between findings 1b and 11: the user’s proposed remedy for missing glyphs is to let them supply their own.

4★ · 0 upvotes · 2024 — “I wish I could add my own symbols too. Other than that... Great app. Thorough selection of characters.”

4★ · 0 upvotes · 2023 — “Lists thousands of various symbols and language characters, although I wish if I could make some of my own.”

4★ · 0 upvotes · 2022 — “Almost perfect. I can’t make my own characters! Can you please add the feature?”

4★ · 1 upvote · German — Schade das man keine eigenen Zeichen/Schriften selbst erstellen kann.
“A shame you can’t create your own characters/fonts.”

Also **3★ · 1** — “How do I create my own” — a user who assumed the feature existed.

12. Floating Clipboard Sizing Configuration

24 voices · 4 reviews · avg 3.8★ · 2017-2022 — the smallest finding, and one where the users are explicit that it is the only thing standing between them and a 5★.

4★ · 19 upvotes — “This app is truely FANTASTIC, However one thing missing, and it’s important — **why can’t i change the floating favorites pad window size?** ... Change that and my review will change to 5 star easily.”

4★ · 1 upvote · Portuguese — O tamanho do clipboard limita muito à usar emojis sem mudar de plano

“The clipboard size really limits using emoji without switching screens.”

4★ · 0 upvotes — “It is a great app for unicode. I would rate it 5, but i wish the clipboard would be larger.”

Two of the four explicitly tie the fix to a rating upgrade — unusually direct evidence that this is a cheap conversion.

The 19-upvote review raises findings 9 and 12 in one breath, so its 20 voices are counted in both. Findings 9 and 12 should be read as overlapping, not additive.

Outside the twelve

The twelve above are **UX findings** — problems in findability, comprehension and interaction, each fixable by changing the interface. The corpus carries two further groups that a UI change would not address, so I have kept them out of the ranking rather than diluting it. They are recorded here in full, because on weight alone several would sit inside the top twelve, and that should be a visible decision rather than a silent one.

Stability & delivery defects — 311 voices, 35 reviews. These need crash logs, profiling and a release, not a redesign.

Defect	Voices	Revs	Avg★
Crashes / won’t open / force-closes	177	16	1.6
Slow start / lag	64	5	3.2
Conflict with MS Word spell-check	43	1	3.0
Install / download failures	20	9	1.2
Regression after an update	7	4	1.2

Feature requests & product decisions — 100 voices, 16 reviews. Each is a call on scope or policy rather than a usability defect.

Request	Voices	Revs	Avg★
Favourites backup / reorder	34	5	4.0
In-app feedback channel requested	23	1	4.0
Perceived abandonment / Android 14 compatibility	16	4	2.8
Monetisation confusion (IAP prompts, ads)	14	4	2.2
Content moderation (swastika)	9	1	2.0
Math equation composition / fractions	4	1	3.0

Read the crash cluster first. At 177 voices it would rank fourth overall, ahead of nine of the twelve UX findings, and its 1.6★ average is lower than any of them. It is tightly dated to 2019–2020 and every review describes the same arc: the app works at first, then force-closes on launch permanently. It stopped generating reviews as install volume decayed, not because it was fixed. Slow start (64) and the Word conflict (43) would likewise place ninth; favourites backup (34) tenth.

Weight accounted for: 1,219 voices sit in the twelve findings and 411 in the two groups above. Nine reviews appear in both — a crash report that also names a missing glyph, for instance — so the two sets together cover 274 reviews carrying 1,536 voices. The remaining 360 reviews carry 504 voices, and 278 of them are under 25 characters.
